

107th Knowledge Seekers Workshop March 31, 2016 (One Planet passport, Pain Pen report of energy flow, Pens showing the fields on water, Agriculture Presentation, Pain Pen innovations.)

(:06). (:08). A man said what you have done in sharing knowledge is against the rules, and they are proud to share and help mankind. The people controlling the finances controlled the humanity from becoming peaceful. The world leaders now understand they need us. In Dubai we introduce a One Planet passport, we create a passage throughout the whole planet, the birds don't carry passport. (:13). The armies go from defense to production of new technology. Bring the Iranian scientists in and share knowledge for Nuclear contamination, the disclosure from TEPCO last week will change the industry, to test and come up with solutions. (:17). Gans used in Nuclear Reactors literally takes away condition of meltdown. Add the Gans to the cooling system of the nuclear reactors. We know the major powers are listening we invite them to join with Iranian government nuclear industry to develop these tools to safeguard the reactors. It can used in transportation of radioactive materials in case of meltdown. (:22). (:26). On the video we see a G field flow, you can see the MG force fields, confirmation of the flow of PI. Taiwan KF shows video. He can see the energy spin. (:31). Copper wire uncoated on Styrofoam on water, move it with coils, one repels and the other attracts. Second one they used a N wire, clearly repels and attracts. Styrofoam interferes with static electricity, use a piece of woods. (:41). Taiwanese scientist was the cause for the blueprint release 2 years ago, his government gave it to him to study. They use ginger on tip of Pain Pen because of TCM, Keshe suggests taking whole ginger bore out center and put coils inside. (:44). Experiments with different P Pens, psychic person told how the energy flows, different width and range of energy, 3 wire pen went narrow and lightening speed, 3 wires and 6 PI batteries goes wide. (:48). Keshe says at moment we are testing a number of pens, results strange but positive. The 3 wire pens create an unbalanced field and you see it in this paper, you should use a single wire for balance ?? With the PI batteries it's very concentrated in the beginning. The 3 wire 6 PI battery Pen are the same way the helmets are made. (:51). Collaboration with Chinese Medicine. Their MaGrav power unit got 90% reduction. There is a new development on the MaGrav car units can be made much easier and more effective, Renan will explain. Funding will come from the Taiwan manufacturing, they need training how to handle N materials. (1:02). Composite Gans packed in three bags, CuO₂ Gans, put into a CO₂ packet. Yes this is what we were teaching yesterday. Since you made a composite Gans you don't know what Gans and how much inside by packing them separately, you can dictate the strength, position and the way you want the fields to interact. (1:06). The Gans packets are within Gans packets, you can move the CO₂ to one corner for example. You can move it and change the strength by mass, you can concentrate the fields, if you are dealing with deep or shallow pain, if you are dealing with a cancer you can start targeting. By using freezer bags which are made on a grid, you can fill in different sections with different Gans. We have to learn this new structure. We used the patches but now we have to become more sophisticated and understand more applications of it, how it will do and how react. When you mix the Gans together it's totally random, this way you can control what you are doing. These can be used in conjunction with health system, coils in a box people walk in to. (1:10). With this system you can concentrate the energies where you want on the

body. Huge amounts of applications. You could wrap one of these bags with all the Gans around a Cup and receive their energies. This is the next step in Gans use. In Austria they start working with the doctors and trials. I started with the Cups and helmet, now you can dictate where you want to put the Gans. (1:14). I used to put the Gans in specific positions to target it, used circular magnets with Gans in center to target organs or whatever. The body on the Cup. You can use these bags to target repair of a heart valve, dissolve cholesterol in the blood vessels. No need for operations, you target a balanced E and P change. If you build these systems please come into the KF and we'll collect the data. With the doctors they think in traditional University training way, we have to add to the knowledge, like when Homeopathic came in, the doctors couldn't see anything so it wasn't medicine. (1:18). There is no FDA, we have to collect the data. We used this with doctors in United Arab Emirates with a cancer patient, immediate relief of pain. I have done it for 15 years but very difficult to make a full body system. I can teach doctors through my certification to use and build these systems and insurance coverage. (1:25). We are not all but only part of the solution, another alternative way. (1:27). Austrian updates what the doctors are doing. Heather has been doing a lot of work with the Health Pads. (1:39). The helmets and "Health trees" where you stand between coils. In these systems you can target the kidneys, or lung infections. When you change the lung operation the other organs have to adjust to it, so you can use other coils also. Because they adjusted to the sickness now they have to adjust to the changes towards balance. This is one of the most powerful systems for this treatment, because PI spectrum you also treat the E. If the lung problem is E you not only change the P structure but the E, and adjust the whole body for the changes, and the brain can adjust. (1:44). When the doctors understand they won't go for the tablets. These systems are perfect for immunization, in time we'll teach you why. There is a court case in Italy that the immunizations have a high level of Mercury, and the court has awarded penalties to the manufacturers. The cause of the problems (mental illnesses) is using Mercury and Magnesium together. You can use these systems at the point of infections, use the patches with it. You take a weakened condition of Measles in the Gans condition, as we saw in the TEPCO trials with the mice, and feed it to the child, pure only what it is, what will be taken. Or you can allow the child to replicate as a system ?? .. that the body receives an energy balance in a PI condition of the Measles, and then the body starts to build its own immunity to it. We are not giving any outside chemicals to the child. We cannot leave our children unprotected. We can work with Pharmaceuticals to introduce the Gans drops like was done in Japan. (1:49). Again, we make a Gans of the disease and allow it be drunk, then the body takes what it needs and the energy to immunize itself. We are here to put forward a new direction in the world of medicine. These problems with immunizations as a lifetime problem. We can give the Gans drops at the time infections. Those members of Pharmaceuticals, high wages justified ignoring the data, and the politicians knew the children were being injected with the poison. (1:52). CO₂ and CuO₂ Gans is as natural as the apple you eat. In the 70's and 80's when the injections were separate we didn't see many side effects, the problem came when they started to mix it together they had to use agents like Mercury and Magnesium to gel the 3, without interfering with the operations of the body and that has caused the problem. The way we make the Gans of orange, banana, and the Gans of the virus TEPCO used to overcome the flu, it should be no different to do the same with Measles. You can test it with just a drop in the glass of water. (1:56). We need to do this

because this is how we change the course, we don't need the permission to save our children from the hands of the directors, who hide the data of the research. Peter of Belgium was put in a mental institution because he stood up. (1:58). The Chicken pocks appears on the body you can extract it and make a Gans of it, and give it back to the child because it comes from the same, it creates and cleans up. In Space we don't have bacteria, which is the AA of the man. Man's AA is the fingerprint of this planet, the rest is virus, which means the energy that attaches itself to the AA body of the man. We need to understand how to operate these systems. Most of the deaths will come across this line where the P has created a process for its P existence and its E for capture of energy, if we can condition in the Space that we have no need for these 2 the lifespan of man will come into millions of years. We don't get Measles in our legs, it's a process in our digestion System, breathing S, and the P part of the body, the biggest problem will be if we do not get educated and find a solution very soon, in space now you have your brain which is again made of AA and it will be capturing energy packages by viruses to different parts of the brain in the space. (2:00). When we learn how to operate the viruses out of the P part then in the space, the instant it touches the brain it blocks the energy packages to the structure of the brain, we can do the same to reverse it. The Taiwanese showed us the flow of the Pl, if they change different strengths btm the ?? pots how much the change of the speed of the float will be. If we increase it goes faster, decrease slower. If we use only Gans and not the N coated because the body is made of Gans, the Austrians can check this very rapidly, they can start calibrating the strengths, how fast it goes when you connect all the 6 (coils) and then connect to the Pen. (2:02). What if you put 2 with the tissue of the body, these are the data we need so we can show to the medical world this is what it does, put a glass of water inside, and a Gans inside and see what is the change of the speed. You have to start creating tools calibration that we can show, man needs to see something moving, numbers. (2:05). We need to come up with data. We are the ground workers of the new technology. Heather at a retreat put the CO2 Gans under the center chair and the people had an easier time to process E. (2:08). Keshe says to add some ZnO2 Gans to it also. Zinc reaches the E and CO2 connects the whole process. (2:10). He will add to the knowledge, draws CO2 on board, this is your connection line, COHN (AA), to the left ZnO, to right CuO2, CO2 works with everything, because the O in all these is the G holding together, Why the CO2 works perfect is while the O behaves as a G holding them all together, here the C works as a communicator it's a line of communication, this is how its energy is distributed, and it positions itself in the structure, this why whenever you want to hold onto info and communicate together use CO2, it's the glue to the whole structure. CH3 is the same, understand the science behind then you can innovate. It also creates a line of communication, then it releases H as the simplest form of energy, that's why alcohol, sugar are so effective because of the link to the line of communication, which is the C, and now the energy is free from the H to be consumed and delivered, that's why you get drunk so fast ?? ... if you want to make sure a system connects to an AA use the line of communication, if you want to hold on to it to deliver something always use Oxides, because O is the G field within the structure of the liquid in this planet in the Gans state. Once you understand this then you can play with whatever you need. In the book we call this scinthilization matter state, but in fact it happens in the Gans state (CH3) also, now you have a H in Gans state available for the radiation released by N or the extra energy, to release the extra energy from the H. (2:13).

That's why the system is so effective. It has taken years to develop it, in the 1990's I could see it. We always looked at it in the matter state, when we opened the Gans state in early 2000 then it all became apparent. It doesn't make sense in matter state because you look for electron positioning, as PI absolutely perfect. Why you use oxides, because they lock into (? the AA), in the process of the viruses, most that come into operation in the body, usually sits at the C connection, that's why use CO₂ for viruses, because you connect to the energy level of the attachment, in the line of communication, but you have itself the process of reduction in energy that it transfers back to the H to be consumed (via AA ?). If you understand the process you can use the virus energy to the benefit of the man instead of harming. (2:15). But you have to know how to attach to it, this is the principle by which a lot of things work. All the salts in the body work through this line of communication, understanding the different parts of the AA gives you an understanding of how to work. Heather shows her stuff. Can water be charged with vials of Gans, instead of direct contact? (2:20). It's not of the same strength but more or less the same, yes. It's because you deal with a PI field and they cross, during the interaction they lose some of there strength. Let's say you have a Zn underneath but you receive the energy of a Cu, this is the difference the interaction and release some of it in the water. When you use Gans outside in a container like you are doing, the plastic becomes a filtering level barrier, because it has to cross the ??, you will learn that the containers are the reference point filters (for the Gans), anything which is within that limit of say Cu, is dictated by the Cu, will be absorbed or balanced in the Cu level and the rest will transmute through. (2:22). Is glass container better then plastic, in a way yes, but it depends what energy you are expecting to receive. Different people can drink from the same cup with water but they show different reactions because maybe the CO₂ which you created is not at the level which their body, or blood ?? position of the Gans of their body is a recipient also to show such an effect, they absorb it, but lets say that it makes somebody happy because their happiness spectrum of the Gans has a specific strength and to the other person it's just below it, so they say I feel nothing, it didn't work on me. If you change the Gans content, or put another Gans content a little higher, now the other one says he didn't feel anything, so understand the totality. Life, the composite structure of the body is different for every individual and we absorb energy from the Gans is a different spectrum for different kind of E. The ocean Gans water felt more powerful the people, because with the Ocean you have the Gans of all the elements of the planet. In Ghana when they put a Gans of CO₂ or CuO₂ in the water how much the difference of the absorption of the elements from the contaminated water. (2:26). When you make a Gans depending on what composite the Gans has that you use, you dictate what elements are in that Gans, or what are left behind. You had warned about using the seawater because it can pickup the radiation in the water, if a Gans can re-pattern a GMO seed to its original blueprint, and deactivate the radioactive material at Fukoshima. No, no ... don't misinterpret. The report from Fukoshima they took the mice and fed it CO₂ and then tested them, there was no flu or radioactive materials or highly reduced, but you have to listen to the other part that was discussed, they found the radioactive material and the residue of what they gave as a radioactive material in the water, in the urine and feces of the mice that they collected. (2:28). It carries the radiation out of the body, it doesn't neutralize it by creating something else in body, that's a big difference. We swim in the Ocean water, etc. and has swallowed part of it and it hasn't killed us. It's there but the concentration is different. The

psychic people liked it, wanted to bath in it etc. Yes, because it covers a large spectrum of the needs of the body, we take things because we find them satisfying certain needs as a spectrum. (2:33). German guy says you can use unrefined rock salt, you don't have the pollutions, or radioactive materials in the water. They can also mine rock salt from deep mines and not evaporated Ocean water. (2:40). Agriculture presentation from Australia. He did experiments with Gans, Nitrogen Cycle. (2:44). Aquaponics using manure of fish to feed the plants. Only uses 10% of water as normally used in the ground. He used a double walled cup filled with CO2 Gans and soaked the seeds in that. (2:48). There is only slight difference between treated and untreated. Experiment 2, filled pipes of Gans around the plants, not much difference. Third experiment with Gans mixture floated in a bottle in the tanks. The roots of the lettuce with the Gans bottle had healthy roots, whereas normally they get brown and start to rot. Second result the lettuce doesn't wilt in midday sun. The harvested lettuce yielded 3 times in weight. (2:59). (3:06). Summary of results. Keshe replies, the Chinese showed that the plants do better in frost and here heat, this is confirmation that the Gans is independent of temperature and pressure they absorb the energy they need. Keshe asks about the flow of the water through the troughs. (3:11). For the farmer it's about a 30 to 40% increase in income. (3:16). Keshe explains that the PI energy is like a sun it radiates its energy unconditionally all the time, so you have millions of little suns in that bottle which will radiate its energy for hundreds of years, the plastic will decompose but the source of the energy will be there. Change your plastic bottle at least once a month, because the energy release is huge, it doesn't matter to how many millions of gallons you apply it to. This is what happened in Fukushima in one container 400,000 liters of water, a small amount of CO2 is good enough to clean it up. In the report on Fukushima we saw a little machine cleaning up 400,000 liter tanks very rapidly, it's very simple, they collect the residue at the bottom of the tank so the top is clean, that's why you need such a little pump, the filtering system at the end is capturing CO2 collected off the Gans at the bottom. We advised them to pour the Gans at the top of the tank and it settles at the bottom, they measured the top and no radioactivity and empty it, dump into the sea, and filter 1 or 2 liters of CuO or CO2 Gans. The energy in these bottles will go for centuries, because if the sun dies a PI dies. (3:19). Why 50 ml can treat 22,000 liter tank because it releases its energy in a balanced way. It was documented 7 years ago in Belgium. Here's a test you can do, if you increase the amount of Gans would that increase the harvest? Yes up to a limit, if you put one bottle in middle and on the end the circulation keeps on adding, would your fish grow in size also. Now that you have the bottle do you need the fish? Do we need to capture other animals to benefit us, now that we have seen the cycle, that it works. A couple weeks ago I was in Dubai, it was Iranian New Years, they throw the gold fish into salt water to kill them. Another experiment, hang CO2 Gans in the air, atmosphere and not only in the water, so at night they get CO2. (3:25). He knows his customers, Keshe says to ask in a few weeks if there is any change in the customers, if they have the social structure calmness because they receive from the plants what they were short of. Now through him Gans has become part of the food chain. He's the first person with Gans produced crops. German guy asks if you did this trial in very harsh conditions like in desert and cold climate, he thinks the results will be even greater. (3:28). We will be doing this trial in United Emirates in coming weeks, testing agriculture in desert. In Dubai every tree has a water pipe to it, they would die without it, he is trying to see if he grows with the moisture of the desert. In the morning

everything is soaking wet. It's not the supply but being able to hold on to the water at the point of need. (3:35). Rick shows some Pain Pen, 3 little glass bottles of CO₂ Gans with a pin going all the way to the bottom, double coils coated with CO₂ Gans. Can you take a picture of the field flows. (3:40). Keshe draws a double coil G and M, which I always promote, and a Center Pin, you create mono fields, they go in a constant, when you start adding multiple layer coils each one creates different fields, he shows a graph, when you mix fields you get the jagged line and you have no control, you don't know what you are feeding, what comes from where, this is why I say do not use multiple (? center) Pins because it doesn't serve any purpose, people think they twist it back and they're connected, they don't know what they are doing. (3:42). Or what strength you're delivering. We DON'T PUT any GANS on the coils because it's enough, ?? a Gans the Cu, you put a CO₂ on it, connect it to the E you have a Gans ?? Cu, that's why you then decide it's going to be an E Pen or a P pen because it's CuO₂, that's all you need to do. These multiple inventions, turning ?? you have to measure but can you repeat the same. Because when we do this ?? (single wire pen) we know the spectrum it's one continuous, here when you mix (multiple coil) then you have everything, that's why ?? the jagged line of Taiwan presentation, there's no pattern, no strength. The KF Pens are effective because they are concentrated, here you have disperse (-ment) , it looks good, you have a lot of things going on, but does it serve any purpose. If it's concentrated heavy it does its job. We have to try to experiment for the knowledge, but for what purpose do we use, or do we just deliver huge amounts of M & G fields hoping to catch something back or feed something. It's very much like the Pads do you want to concentrate to add. Why not connect the M and G coils to the Center pin that you deliver a homogeneous but powerful system, but let it be delivered in one end.(3:44). There is no use taking from G and giving it to ?? (M), then repeat this and make specific Pens for specific conditions, but now we don't have the knowledge, we are just making things, ? we need measuring tools, it's a mixture of ?? Should I focus on all CO₂ in the pen, Keshe says we don't focus on anything we are all in the school of learning, we have to know what to do with the new knowledge, what is the result. We are testing things ourselves, do we need these for diseases. In the world of PI technology there is nothing wrong, it's just finding what fits to where. There are many possibilities, but when you do mixture this is what you get. Maybe we have to use 3 pins because it gives a spectrum. Also depending on what Gans coating we use. (3:47). Your CO₂ Gans glass bubbles on the top emphasizes on E, so maybe one you put CH₃ the red one increases the energy for whatever it is. The CO₂ one is very E, it touches the communication line. There is a use for the spectrum of fields in the health section for accidental spinal cord damage, when there is a pressure on the spinal cord it squashes the nerves together and breaks the line of communication. If we could find a way to connect the nerves, which are in the nano size from above the damage around to the other side below the damage. (3:53). Each nerve carries a specific bandwidth of info, it passes through the Nano material which creates a spectrum of fields and reconnects with its match on the other side of the damage. He has worked on it for years but has not yet found an answer, maybe the composite Pens can do it. Heather asks about using the Gans patches for that, he says it doesn't work I have tried it. You can try it. We can grow nerves anywhere in your body, if it is cut straight, when it is mashed up it can't be. (3:56). My agreement with the Iranian government was too only work on Space technology and not interfere in the health side. In Iran he tried to help a girl with a

smashed spine, the body which was unable to move for 6 months started jerking and move, but he couldn't get any more than that, so the Nano materials can connect nerves. But we don't know how. When the sudden flow of energy to the muscles that have been dormant for long time creates a lot of pain to get it going again. The same with people in Coma and when they come out, it can damage the fibers. We had to stop because the pain was too much for the patient. It has been done with smashed nerves but it is just luck. (3:59). Keshe asks the Australian farmer to genetically check his lettuce to see what happens, we know that it changes genetically but does it go back to its origin. What is the change in the structure of the Lettuce. The GMO is when they take a plants genes and transplastex or mix it with a gene of an insect or animal to give it a certain characteristic, whereas a hybrid seed is a cross pollinated with other plants to get a desired outcome. The GMO seeds can only be grown once and not use the seed for the next season, you have to buy it again next year. (4:03). Keshe asks him to take a GMO and treat it with Gans and see if its seeds can grow again. In India farmers commit suicide because of the burden of buying the seed every year. I know the answer but I want you to do it. (4:05). Renan presents a health case, at 3 years of age I had trouble standing up, doctors said muscular dystrophy. At 8 years he got better but then fell and got worse, now in bed and totally immobile. He shows lab test results. Keshe needs to consult with a doctor. Let us stick to the new Ethos, knowledge shared can be used. MaGrav Units are now on sale directly in Italy, distribution on the shelves in the stores. The new systems don't require 20 days to set up, just watch the meters.
