

## 20<sup>th</sup> Knowledge Seekers Workshop – July 24<sup>th</sup> 2014

- **Main topics of this Workshop**

- **KS Talk About Their Understanding About the Technology**
- **Explanation About the Cup of Life**
- **Cups of Life are Like the Breast of the Mother**
- **Why the Cups Don't Have Germs**
- **Update About the Reactors in the Lab**
- **Creating the Environment to Bring In E.T.**
- **Creation of Cosmic Plasmatic Fields in the Lab**
- **Connection Btw the Reactor and the Structure of the Human Body**
- **The Creation of a Solar System**
- **Explanation About the Supernova**
- **Brief Explanation About the Fluids of the Body that We Reject**
- **Measuring Plasma of the Elements**
- **Bone Cancer Does Not Exist**

(:03) Marko assume and talk about the process of understanding on this technology, starting with Nano Materials, then to Gans and then to reactors. Talk about the importance to start to understanding things from fields point of view. Marko talk about his understanding about give, and take just what we need, the work of the Plasma. (:09) Marko talk about the new configuration of the reactors, and that they observed much more control over the system through this new set up. (:11) Question about what he means about sealed environment. Marko say that he can not disclosure about this. (:18) Marko points out about start to looking in our body the Magnetic fields interactions, and how we energize our blood and Lymph (as it was said in the last WS by Mr. Keshe). (:22) Question if they can feel the MaGrav fields. Marko says that he can feel some interactions, specially with the people he is more connected; and that they are trying to manipulate with the mind the reactors and they are getting interestingly results. (:28) Marko says about the importance to train ourselves to not put violence not just in our actions but in our thoughts and intentions too, before we live this planet. (:34) Rick and Marko talk about the simplicity but at the same time depth of what they are doing and understanding. (:36) Ivan assume talk about the tests that they are doing with the reactors, and the amazing results; in one occasion creating the Plasma and in another occasion destroying the Plasma, which happened yesterday in the morning when they added Ar; but they could be able to build the Plasma once again, in very short time. (:42) Ivan talks about the importance about give the knowledge with Love. Ivan says that Mr. Keshe explained to them about the cup of life (not very much different of what Mr. Keshe explained in the last WS. (:50) Armen assume and talk about the cup, that this cup will give all the energies that our body needs, but first we must understand what Plasmatic field we are going to create. WE are trying to understand this new science. (:52) **Mr. Keshe comes in** while Armen tries to load the pictures of the cup of life. The position with these cups. When we released the Coke bottles there were many discussions about what was the liquid in the Coke bottle, when we explained how simply it was caustic it change a lot of people's mind how simple it is. Last night when I shoed the cups for the

last time for the KS the secret with these cups is not the Nano Coating on it, but the process of Nano Coating. You've got to go to the structure of the human body and understand how when you are born life is given to you by your mother, you suck the breast of the mother, what you receive is milk, and milk in itself is composite consistence of everything you need to grow Brain, bones, intelligence, the teeth, and etc. You are receiving the totality of what the body needs. These cups that I showed to the KS are in color purple, black, orange, yellow and whatever color you can imagine. Armen wanted to know how we made it, so what I did, I explained that you have to understand why the color of the milk of the mother is white, so I brought the liquid of life which I built these cups in and the color is exactly white, is the color of the milk; it is not the caustic which we use and we've been used to, in fact what we embedded in these cups is the memory and the consistency of the milk of the mother; whatever you receive in the milk, when you have a glass of milk, each has a specific MaGrav field, and this is why the color of the milk is white. So I put the container where the systems were made and I explained why they have that shape and their lining, and the material you can literally touch, this material that I made the cup out of is very much like cream. So this is not a normal caustic, to build the cup of life you need to put the essence of creation in the original container, so these cups literally are the breast of the mother. As you receive all the nourishment through the milk when you are breast fed, these cups are built in the same kind of environment, it is not a normal caustic it is (??) let's stop the other things which I do because we understand the process and the intelligence of it, is very simple. So these cups are nourished and embedded in the milk of life. We allow the cup to have the spectrum MaGrav field of what the body of the man needs. A child does not receive anything but milk of the mother. So liquid for this one is made in the same process, as I said is milkfish white and the exactly copy of the milk. When you make coating each layer, each gap btw each layer is totally and slightly different from the other one, so when you drink from these cups you receive the full spectrum of the Plasmas. (:58) Somebody interrupts saying that this is the most strange thing that he ever heard in his entire life, and that he is out of here. Keshe: Who is this on? The guy left. This is what you've got to be aware of, these kind of people are paid to be in these places, they pretend to be. We have been sabotage from inside the center which we will explain in due course later on. There is a lot of forces around trying to stop this process of giving knowledge. (1:00) Back to the Cup. The material is absorbs and transfers spectrum energies. The reason for the transfer, if you see in the pictures of the Cups, these cups are coated both sides. The reason for it is due to receive only what is in the cup, not outside it, at the same time when you live the cup empty, the environmental energy is received. These cups not only you can drink from, you can put your food on it and you can breathe through it, you receive the energy which you need through information that you receive through the Plasma conversion. These processes of breathing through the cup have been part of the development of the Health section for years, and this is what you've got to go back to the biological part of the technology. Your stomach is the feed for your P part for energy, your Lungs is your feed energy for your Emotions and the Brain part. When you breathe the energy which is absorbed O through the blood it is mainly for fast delivery, for fast operation of the Brain. That is why when you breathe through the cups you supply the energy to balance the structure within the Brain and when you drink or eat within the cup you feed the P part. How you can do it is very easily and you understand why these cups

is made the way they are. There are only 10 cups made; the combination of 3 cups will give the food that you need, but what about chewing, you like to eat, you can eat and chew, but what happened you get fatter, because you receive what you need from the cups and now you eat more, you chew more then you put more weight on. **(1:03)** You've got to understand that these cups are not the normal cups as you made in your Nano Layers, these cups are in different colors and shades because it absorbs through total spectrum and what is not there to be released to the water inside the cup. You can not wash these cups, so then you change the structures. I explained why these things don't pass germs. Go back to your knowledge and your understanding of connection of the wires, even though you touch the P, the underneath layers are Magnetic field and nothing can be stopped in these layers, so if you have a germ and you drink from it and you leave in the cup you can not connected the two wires together, because of the Mag field separation btw the layers, the same thing happens with your saliva, so by just rinsing it you go to the next process, you can not contaminate these systems. People who work in the nuclear fully understand what does this means. It is used in satellites in the upper atmosphere, because in the atmosphere we have germs, and when they attack the satellites they can cause damage. **(1:05)** Keshe says that they opened the doors of the lab for the high level world scientists. Keshe explained to one of these high level people about why in the surgeries they do in the operating room, then when you don't need to touch the skin, and what you have to do and how you can stop a lot of pains, or if you cut the nerves how they can re-organize and re-connect at the point of the operation. He asked, why they don't teach these things in the medical school. Keshe says that from today the Foundation becomes an International Organization. For the next 2 days the Foundation is shut down by high security for Governments. One of the biggest problems that the Government have with us is how to disclosure the knowledge to the public. **(1:08)** We were supposed to go to Bulgaria and organize the things there. The KS will have a rest. Keshe talk about the reactors. **(1:11)** Two reactors are ceramic, but they have a center pin, no coating on the walls; and the other two reactors have a coating on the wall and no center pin. This is the first time that we have gone to the 2 dimensional reactor. **(1:13)** When John comes back we go to the next level of the reactors, we will get a much smaller reactor, they will be rang, and then you will see a 3D interaction Plasma reactors. For the first time through Gans we re testing behavior in 2D; the reactors have been put on transparent plastic base where they can move any direction they like. Their fields forces internally that will decide their power. The size of the reactor is irrelevant; these small reactors can produce as much interaction as the (??) even more effective. The Gans is a Plasma state itself. We created the Nano Layers and then we used the Nano Layers to create the Plasma; the Gans is itself in a Plasma state. So it is easier to control and develop, the only problem we have in this is state is that the Gans are very much in combination of matter and Gans because of the way we produced, and in the future we will produce Gans in slightly different way, we need the liquid water to keep them suspended then they stay dynamic. Armen has loaded 30% of Gans and 70% water, in the process we can extract the water and add more Gans, but as in Plasma of other reactors we only created one type of Plasma from the H; I have to put in the right order that you might understand. In these reactors we have deliberately loaded different combinations of materials in different reactors. One reactor is loaded with CO<sub>2</sub>, one ractor is loaded with CuO<sub>2</sub> and one reactor is loaded with CH<sub>3</sub>. As I said some people thought that could

sabotage the work of the Foundation, they do much better for us. Armen spent some days making the CuO<sub>2</sub> for the center core, and out of nowhere in the next day we found that CH<sub>3</sub> and CO<sub>2</sub> was mixed in these mixture, that it can not be used. The color has changed to darkshness green color, in fact these gave us the opportunity <audio break>... It has the field of all the three reactors and interacts with it very nicely. **(1:18)** In these reactors we have a mix of material which we produce in the orbits and the Mother carry the information for all 3 of them; but at the same time, because the CuO<sub>2</sub> came from the same source as the Brain which is upstairs. Now we have not the control from here directly into the Gans center core, now through that we can control very easily the other 3 because the other 3 have their own source within the same material. The Ethos of this Foundation is in the base of Peace and the correctness, even the people who try to destroy us they give us a helping hand. This mixture of Gans is a gift they gave to us in their stupidity; that has been a help for us thank you very much. **(1:19)** We have now a Star Formation with Gans, then we have a SF of Gases with Plasma, and then next to it we have a confined environment sealed where we work with small layering of H. For the first time now we have 12 reactors on the floor next to each other. The Gans reactors are running at the high power motors, because we have to measure their property. The center cell is motor shut down by the Plasma interaction; and a confined unit is switch off, sometimes we turn on, and we discovered that switch off and on does not make much difference in the operation of Plasma. We turn on the motors again yesterday. **(1:21)** We keep the Plasma dynamic btw the 4 reactors without the use of the motors. If you look for the setting in the floor of the lab now we started with one SF then we added different systems combinations, then we added a second SF nest to the other one, and now we have a third SF added. In December hopefully the reactors will be embedded in the Health systems. **(1:23)** We have started to create dynamic Plasmas due to variation btw the cores. What I call the harmonic systems which is the back bone of the creation of atoms where protons and electron and neutrons join in all the structure the way Galaxy stays dynamic was set up yesterday here. There is a sequence of loading with N, and H. Now that we have reached the Plasma condition, by creating different gradient conditions and different Plasmatic flow in each reactor as each reactor is connected MaGrav to the other one it affects the other one, now we have a Galaxy or iter atomic Magnetic flow. We don't need to have the motors to run now that we reached the dynamic Plasma and we have confined it. **(1:26)** All the reactors will be running in the holidays. Now we have seen in part of the operation that the field from the boundary reactors is constant. So it means that there is no field coming in into the Plasma. All the fields are directly from the boundary cores into the center core and to the center core into the vertical take of. So we are adding more and more Plasma pressure; from now on it is not going to be easy to get the balance point, once we get the balance point we achieve lift. We have secure everything through pallets, once the lift comes we can literally move on the platform and put the chair there. We have managed to create shell, we have managed to create atomic structure where the Plasmatic MaGrav fields, the 3 are feeding the center core, and the conditioning is been up o now that as the field of the center are released of the boundary them they found the connection with the center core and from the center core we could see an increase on the vertical forces. Now we see the boundary fields have totally stopped, now the interaction is totally internal btw the reactors. This is a major achievement. As the fields comes out from the center core, its surface feeds back to the

bottom of the cores and it gets absorbed and increases by the Plasma and boundaries cores and it gets back closest to the re-feeding, and to absorbing all the fields conservation, what we call MaGrav conservation. We added Ar, and the Ar absorbed most of the Plasma or reduced the Plasma, I understand partially what and why it happened, this gave us an indication if we need to reduce our strength in an emergency all we need to do is add a dose of Ar to the reactors. **(1:31)** You do not know how much moisture is in the room until you put a plate in the room and cool it and you see the moisture sticking in the plate. It does not mean that the moisture wasn't there, you created the environment for it to manifest as a drop on the plate. The next step for us in respect to try to join the Universal Community is try to teach and show you what these conditions are, and what you think you were alone, you are not alone. The reactors after the holidays will be set to create an environment within the box that allows very much for human being for the first time to be aware of the existence within them that they were not aware of. We are putting that plate in the MaGrav field in a shape of a box form that man can start looking into the existence of the life in other dimensions. We created matter in the reactors, but now we create the next step. **(1:33)** I am not looking for a lift of the reactors, I am looking for facility and understanding of the system, that now we create within the frame the same condition (??). For the first time man became aware of other creations within the world of the Universe, within the man's environment. Before you go to the Space you become aware of what it is and what you expect to see and how you have to do the job to handle; so when we achieve this combination will make a frame box with the reactors in the lab that we can change the environment. When you see another SS you never go in, because it is set up for that life for that environment. Now we create the condition that suits them, to be in their environment but be the guest of humans. This is where we are going. We are fully aware of the existence. The purpose to go further with the knowledge is to be able to create a balance environment within a cubic environment that we create a condition that we can welcome the new existence that is not new, but for us to be able to see that; vapor in the solid state we recognize it. This is how we become aware of others within the environment you are in the Space. **(1:35)** The next step is to be able to create that plate that man can see the moisture in P form, as an entity, intelligent, decision making and a friend. This is how you introduce people slowly to the reality and for what the Foundation is set up and the way we were. I can produce this today but the man will not understand it. My biggest sorrow is how this stupid people used the key we released and they used this Nano material, they are using our technology clearly from what we released to show it in a military, to show what it can do. We know how it is done and we know the military application of it. **(1:37)** This knowledge can be used in both ways and we have seen it. Keshe talk about the meeting that he went with his friend Dirk about the dark materials (Nano Materials). **(1:40)** John talk about the things that need to be arranged with the motors. Keshe says that the motor is behaving like an electron. **(1:43)** John continue the talk about the reactor. <the connection with the SSI drops> **(1:46)** John talk about the data about the fields created with the reactors. **(1:48)** The connection with SSI is back. **(1:49)** John continue the talk about the values of the fields of the reactors. **(1:53)** Lucian ask about the connection with the wires in the reactors, if they were Nano Coated. Keshe: They were Nano Coated. We use the coating for the transfer of Plasma from one core to the other. When you deal with Plasma you cant deal with matter for transfer. Lucian ask if the wires will be oxidized. Keshe: Why

they should be? Even if they get the oxidization it will be only in one layer, you have thousands of layers on top of each other. You still have the transfer of the Plasma through the layers. If you are not using the nano coated wires you keep them in a box. Remember, the whole Nano wire doesn't turn green. It turns green in certain spots, and that green comes through the gaps and holes where the Cu layer interface you get the oxidization. I always say, keep and don't touch it, in a box. **(1:56)** Even when immersed the whole wire or a plate in the salt not all the gaps or all the surface is CuO<sub>2</sub>, the gaps and the layers on the surface change. So not the whole thing becomes CuO<sub>2</sub>, and at the end the air in the air moisture, you don't get that much of oxidization anywhere. Lucian asks if once the Plasma flows btw the reactors the nano wire will be... Keshe interrupts: will be useless. The Plasma goes through the layers, not around the layers. The oxidization doesn't come from the top layers, it comes from the interface btw the matter and the Nano. Lucian asks if when it is oxidized the process will stop and create an interface. Keshe: Yes. Lucian asks about today's picture. Keshe: This is something that Armen made. This has nothing to do with our work. **(2:02)** We need salt to create organic life in this "tree" Nano Coated. That is what they say, that life comes from the sea, we were fishes. Because the interaction of the upper atmosphere with the water, and the salt content and the metal content in the water has led to the creation of life, that is why we are dependent on the water. Rick asks about the ignition key to start life. Keshe: The ignition key on Earth is the H. Rick asks if it is not related with lightning, the form of Plasma as we know on Earth. Keshe: No. If you look at the Nano Layers and the way the transfer of information and energy is done even in your cells where there are salts and links that you create your energy; the minute you connect the Nano layers and the way they are done, the energy transfer comes within what is absorbed btw the layers of the nano coating and the AA and the H movement, that is how it starts from. This thunder and lightning are too high voltage for life, for existence of life you need a very, extremely low Plasma flow. **(2:04)** High voltage. This is the mentality of the man, everything needs to be big to be something. **(2:06)** When you make these Cu wires and put in the salt water, when you look at it your process is not chemical, your process is a Plasma transfer, so you don't see any plates or Cu wire to get the material which is left on the other side, when you collect that material as a Gas. I was trying to explain to Marko how the energy comes through the Lung. This is in book #5. In the first book I explained in one chapter where and how the energy is transferred, and it is in EV in very small amounts. All the releases of molecules in the body are in Plasma form, not in matter form. When you have the interaction in the system you see the release of energy, very little; and that energy that Plasma releases. Maybe next session I will put this formula for you to see how little this energy is. **(2:09)** Why we made these confined tests for the reactors. It is because the condition that the Nano layers have enforced at the Plasma. For example, the energy core is not in the setting this time, the energy of the reactor is taken out, because the center core is nano coated in both sides; so it interrupts all the fields, even the Plasmatic fields. When we added Ar we saw a problem with the detector, in this situation we have created in a sealed container we have released cosmic energy, because it was so rapid, it crosses the boundary and immediately at that level affected the work of the detectors, both in 3D, it was a wide damage because it was facing the reactors. It is very much like the explosion of the Sun, the solar flares of Plasma release in rapid way. We created that condition and we saw how it interfered with the work of the detector. For the

first time we see the creation of Cosmic Plasmatic fields in the lab. You release very small but very powerful energies. **(2:12)** We had a inherent problem in the two small reactors. Because there is a groove built by John in it we had to put a rubber O-ring in it. Keshe talk about the mistake that was to put the rubber O-ring on reactors, that when the reactors were working in Plasma condition the O-ring became like a chewing gun. The Plasmatic field interact with the electrons and protons of the O' ring and change the structure. There is a lot to learn. **(2:15)** Lucian asks if the CO<sub>2</sub> will be pushed for the sphere by the center pin. Keshe: I don't know. Lucian talk about his experiences. **(2:17)** It's very interesting when you mix the Plasma, with the matter, with the Gans. They play different games, one of them becomes the intermediary, one sticks to one and other stays separate. Question about the use of Cu Gans for the interaction with the reactors. Keshe: You've got to go to the biological understanding of the structure of the body of the man to understand this. The fetus, it's blood and motion and work separates the Cu in the blood and in that process that Cu converts and sets the condition for the creation of the protein what we call the Brain structure. You need that Cu in the fetus to set up the beginning of the building of the human Brain cells. This is why in the body of the man in the P part, where there is no nerves in the red tissues, the Cu takes the job of the link and information. If the scientists take of the nerves and create the right condition in the muscle you will see that the nerve system will be built on its own. You can re-establish the neural losses through the right combinations out of the Cu in the red tissues muscles. So, here you have that Cu basis connection. **(2:20)** Partially how you connect through the reactor is through the structure because is the part of the structure of your own body. So, when you sit down in front of the ball, or put your thoughts into the ball, you have to have a matching receiver. Because of this Cu that have in the body of the man, which is replicated n this process in the ball in the lab you already have a pre-destined line of communication. **(2:22)** <lost connection with Mr. Keshe> **(2:24) Keshe is back.** I was explaining how we communicate through the systems, through the reactors through your body and thoughts. So your Brain have part of the structure, because it came from the Cu, so you already have the link, the common denominator link with the Cu, and that is how your Brain was established. I explain this in the book #5. Keshe talk about the books. **(2:30)** Sandor says that when he open his reactor have a strong salty odor. Keshe: This happened here. I think that the salt saturation became very high. What you smell as a sea, we see in our reactors attached to wall of the reactor, literally the salt grows. But there is a difference btw the salt and the CO<sub>2</sub>, because when you position your electrodes in the right way we see structure of the CO<sub>2</sub> hanging, like a white powder. This is not salt, this is Gans state of the CO<sub>2</sub>, but you see the salt totally separate. As the AA are in gas state and change to protein, they do not immediately sit on top of the water, they are still in molecular gas state, till they touch the salt water, then they change into the combination of matter in manifestation, so when you have the evaporation of the water in your lab, as these vapors come up they capture part of the molecular AA in a gas state <audio break>... The gases do not automatically as become the molecule of AA or protein, they appear on the surface as fat layers. Just above there is a molecule of AA in a gas state where with the evaporation of the water, they manifest themselves in the salt in the vapor as AA, they sit in the wall of the container as they grow out. So the vapor you smell as a salt is a natural vapor, but if you have created a CuO<sub>2</sub> green you find out that the salt is not very white, have Gans of CuO<sub>2</sub> in it. **(2:34)** Rick asks if it is safe to breathe the part

of CuO<sub>2</sub>. Keshe: Don't forget that Gans state matter is part of the material that we breathe constantly throughout the environment. I don't say that it is safe to breathe because they can say that they got sick because I said that it was safe to breathe. We breathe these kind of things as a natural process. There are more golds in the ocean than man ever found as reserves in the land. There are more Cu and Zinc and everything else floating in the oceans, and the condition they have been and coming through the same vaporization they go. Its part of our lives, we breathe, its part of the energy we receive. It is the same process when we breathe O and go to our blood cells. **(2:37)** This is partially the process of life. These materials that we breathe according with the position that we are they affect the DNA and the structure of the DNA, that is why we have different colors and shape. Because we don't just breathe the air in that area, in the environment that we live in we absorb the energy very much like the Gans of matter which are floating in the environment. Sandor says that he feels a cool wind when he opens the container. Keshe: I never closed these things, so I can not tell you. We have seen, since we started been operating the Plasma reactors in the lab, that we have changed the environment in these containers. Rick asks if maybe Sandor needs to leave the containers open to facilitate the interchange with the gases of CO<sub>2</sub>. Keshe: We did a test in Belgium few years ago. We vacuum the whole environment, and we put nano layers hanging in this chamber we did tests before hanging. Then we introduced CO<sub>2</sub> gas into the environment, then the scientist did the electroscope in the electrodes and it was shown that CO<sub>2</sub> was encapsulated within the layers of Nano layer; so when you make it available the layers will interact and then covert, or when you make it available the MaGrav field within the structure, attracts and holds and then coverts in conjunction with the salt into the Gans of the matter. **(2:42)** Rick asks how the DNA interacts in those circumstances. Keshe: I partially have explained in the book #5. One of the ways you can do it... You can test the develop of your DNA and change your DNA, and the work of your body as a Gans in a matter state GAns, by using different liquids of your body into these containers. I will not go any further on it, but you can do all sort of things. In the future you will be able to make a copy of your own flesh. In future I will teach you how you can change these fat layers into a chicken, in a P sense. I created in my container the condition of the milk of the mother and that is what you see, and the first 12 cups of life are already on the table. **(2:44)** Rick talk about meteorites and how they have cosmic dust that it is not found on Earth, and ask if these materials would be useful in a dynamic reactor. Keshe: You can use any material, as long as you can bring it in into its Gans state. If I put bunch of stones in the reactor I get nothing, but if I can change the structure of the atoms of the stone into Gans state, then I can use the MaGrav field strength, or what you call their fingerprint to create a reactor which absorbs only that stone to itself. What they call inter stellar or btw the stars, cosmic dust, in the structure most of the comets travel to the outer boundaries of the Plasma of this SS, and as we send MaGrav fields into the cosmic environment we receive the same. The reason you see life on these comets I have explained clearly in the book #4. In environments of the SS they have a slightly different structure temperature, these elements freeze on them, they manifest on them, and then as they come back, this is why you see all the time that these meteorites have a tail, a vapor tail, the only reason is that every time they go to the boundary of the SS they attract thousand of tons of these materials. They are actually a dynamic Saturn or Jupiter. So, they keep on passing the Earth for so many years, and you call Star of David or whatever, this tail of the meteorite

never finishes, because in the orbit they are like an electron, when they go to the boundary of the SS all the MaGrav field of the Sun in that layer is so weak that it changes to matter, it is like the egg shell, but the soft egg shell; and these meteorites with different MaGrav fields as they go through this egg shell mix, it is like when you have a plane and you go into the clouds and you get wet, because you absorb the moisture, these meteorites get these molecules, mainly of H and He attached to them, and in this mixture there is part of the cosmic MaGrav field that gets converted into matter and in this level you have everything. It is the same interaction as we see in the surface of the Sun and the upper layers of the Earth. The interaction btw the MaGrav field layers of the Sun with the Earth in a specific zone and level leads to the creation of N. The same happens in the Solar structure, in the boundaries of those layers you get matter. **(2:50)** You see Aurora in the North pole, and if the meteorite come through them we call shooting stars. The same thing happens btw the outer boundaries of the SS and the Galaxy. **(2:53)** Rick says that scientists have found that there are a stellar particle that goes through stars, and some of these are in the meteorites, and ask if this would not be interesting to inject in the reactor. Keshe: The thing is, if you gonna start a star as an ignition key, you already must have reached Plasma, so you already have the essence of it. If you just change the position of the four reactors in the lab you have a Tritium. If you can manage to imitate the condition of two reactors exactly the same, one slightly weaker, you create Tritium. If you can withdraw or keep this single neutron attracted or busy somewhere then you have no radioactive material in the containers in the waters, so what you do with this neutron, if you can extract enough of it you lead to creation of new materials and you can start a SS, because neutron on its own if you can bring it to a Plasma condition and add them together you start the life of a Star. The Star does not throw materials out, the stars throw Plasmas which are the fingerprint of its own Plasmas, the materials become weak enough and they become the manifestation of that SS or that Star. **(2:57)** Rick asks about the Supernova. Keshe: The condition of the Supernova is again the fallacy of the fusion. The material becomes matter from one star according to the Plasma they release. Supernova is what I call neutron division to a proton and an electron, because internally it can not hold the balance so it split. When the neutron divide we don't get bang in two pieces, we get residues, energies and some other MaGrav fields, because they are not needed. So now you call these residues interstellar stones, or life or material. Its again what they call God particles. These residuals become God particles, and they appear themselves as a cosmic dust, now they are weak enough that through interaction and friction with other MaGrav fields in the environment to become matter. **(3:00)** The destiny of this SS is written, is finalized. So when the two stars hit each other, its not that nothing is gonna left, they become one bigger mass in the center, it is a amalgamation of Plasmas. This is what we try to do now in our reactor cores. In a way is a inter-fusion, because they originally came from the same thing, one is a proton and the other is an electron, but due to the forces, and the way the Universe works they go back together again. **(3:01)** The creation of Black Hole is the destiny of the Earth, read the paper that I wrote, in the book and you will understand. When the two come together you get a big Black Hole and you get the residual, we compare one sun to a black hole and it absorbs other stars to it. We saw this Supernova condition, releasing of Plasmatic fields yesterday in the lab. **(3:03)** A man asks about using his own urine in salt water in his Gans. Keshe: This was what went through my head, I was going to suggest this. When you use the liquids of your body you

will be amazed with what you will see. If you want to understand the state of the body, never test the blood, blood is the worst thing to test. Test the urine and see what comes out, it gives a very good indication of where your body is. Saliva is incoming, what you are rejecting that counts. You've got to see what you reject. **(3:05)** Question if the material can be use to fix something in the body. Keshe: If you ask somebody to give them their breathe, like asking: can I suck what you breathe out. Your breathe out what is already converted, because before it become a matter state, so they've done half of the job, you need less energy to convert it again, because your body uses a slightly different thing then their body rejecting. At the same time you find out why we kiss each other, and why a man and a woman when they kiss have totally different emotion mental state that when kiss a son or a daughter. This is the psychological part of the work. Even breathe gives a good indication of what you need, and how and what you absorb and what you need to absorb. In breathing you give the information to the partner of what you expect to receive, because it's a level which is given directly affects the emotional part because the Lung is for the Brain. This is a lot of things for man to understand why we do things the way we do. What you call interaction of the material of your body with its environment if it absorbs it then you understand why you behave so different, and why we behave in our interactions with other creatures and other entities. What you live out and what you reject is not what you don't need, but in a way your body has already processed in a way that it can absorb it. There is a lot to learn. Next time you kiss your husband or wife you think twice. **(3:09)** Lucian asks about the H atom that we can measure but what about the other elements like C. Keshe: In the reactors now that we have isolated as a SF, because now we are taking so much data, we see now that certain adding of H to a reactor gives us certain figures. This is how we measure the atoms of Gold, Ca, etc. We see the figure and this is the boundaries, they are about the same. We have already started that process. We can say what is the Plasma structures of Ca or K. **(3:14)** We have a detector inside the container environment, and we have a detector outside looking to the behavior of the Plasma inside the cage. We see the interaction of the whole container with its environment. We can see when is the behavior of lets say Cu, and we can see too how this Cu will interact with Mg if you create an environment of a Mg, what measure will be so we can produce and expect what will receive. Rick asks if a proton can be measured. Keshe: It depends on the environment. The size of a Plasma of a proton can be inside what you see as a matter or can be the size of the room you are sitting. Depends what MaGrav field of the environment allows the Plasma to grow into. **(3:16)** The behavior of a Plasma in a funny way is the same as the behavior of a gas. But the gas fills up the environment, but with the Plasma you've got a central core principal which holds it together as well. You can have a gold of the size of this room as an atom, or you can have in the size of the ring. On the surface will be the same, on the boulder of matter state will be the same. Is what you need and what you allow to happen. **(3:18)** In a Health point of view: The same Lymph takes different directions and different sizes, but it's the same size Lymph. This is why I support Chemotherapy, because I understand this. A Lymph when receives too much energy grows, expand enough and when it sits on the bone literally kills the bone. Bone Cancer does not exist! All it happens is that the Lymph cells grows big enough that when they attach itself to the bone the bone can not receive and be used for its purpose. It is like as I said with Marko, let me sit on your lap for two days and you will see the (??). You suffocate, you block the receivment of minerals to

the bone. So is very easy to reverse what they call Bone Cancer. This is understanding the structure, it is the same cell but where it sits and how big it becomes. In the Plasma state you take the size accordingly with what the environment allows it; in the cancer term when you use Chemo you put too much energy in the Lymph, so it grows and get bigger which can not go through the hole of the bone to become bone marrow. So in a way it is like you put your hand in your mouth, you can't breathe. Working with a Hospital in Germany we have managed to reduce the size of the Lymph so that the body can work and the bone marrow operates normally. We work very correctly with number of organization and they proved that we are right.
