

52nd Knowledge Seekers Workshop Mar 5 2015

One full year since started. NEW University started.

Last week started to look at the shape of Principle Matter in the Center of the Universe. (12 min) The physical structure of the Atom and nucleus. We usually see more neutrons. For the neutron to reach the division point of proton and electron they have to loose their surplus energy in Plasmatic field form. When the Energy in the plasmatic MG field, the fields have to be absorbed by partially the protons and electrons in the boundary. Energy is released in a spectrum of fields. In the center of Universe there is a Source or a Reserve Tank, it has a spectrum, the further you go in stronger becomes. Energy absorbed from within structure plus from outside in universe. If you understand this then its the same in the body absorbing into skin and nails?? There is a new type of radiation, higher order then Gamma, not detected because they are plasmatic. These difference forms of radiation will emit different colors. (27 min). In the plasmatic MG fields can slow down enough to behave like Gamma rays, but can be harmless. All things on planet continuously releases these kind of rays. Going into a new phase as Knowledge Seekers, understanding creation. Developing a instrument to measure MG fields with modified Raman Spectroscopy. (53) How did he know about Gans of CO₂, lady accused him of being an alien. Aliens have a different DNA then humans. You add to the knowledge and the advancements add toe RNA. Biggest problem of man fear of Unknown, and admitting that he doesn't know. (1:08) Bret left CuO Gans in container for months, starting to grow? Black dots in Gans, Nano particles that didn't convert to Gans, these become hair or nails, bones carry this structure. Nano is a MG field and links up with Gans "tendrils", but they're Magnetic fields. They become a composite of Nano and Gans, nothing can stick to nano, but magnetic fields makes a composite. There's a red sphere in there, Fe got in there formed hemoglobin. This is the next stage in knowledge. Indigo color comes from CH bond, plastic. The Foundation has to create a database for new materials being created. Someone wanted to invest in K Foundation. It must follow ethics, no patents, can invest in spin-off companies. But the knowledge is free. Iran is using nanoclay particles to air smog. When you know that the competition has the same product, become more relaxed. In coming months hue amount of products will be sold on Keshe Foundation. (2:10). Merging of gas with Gans materials should be able to create composite reactors. This converts Gamma ray with Gamma radiation. Need them in deep space, do not need to carry radioactive materials. In a way its good-bye to nuclear technology as we know it. It's unknown science, you have seen but not understood. This is what happens in upper atmosphere and it creates N. It's the field of the Gans and not its presence. You don't touch the Gans but just transfer the energy of Gans. This is how Universe works. Walk away from the barrier of physicality. You don't need to sink your seeds in the Gans. Last week they produced water in boxes. What you need you take, what you don't need it takes (as in getting rid of disease). The juices from pancreas does this, information of rejection what the body doesn't need, through enzymes puts back into intestine to eliminate. The gas outside becomes the lymph and the core inside the intestine, or visa versa. You learn every subject at the same time, at the University. It takes time. (2:33). Nuclear Energy is the rapid delivery of fields. This can be done without radioactive materials if the need is there. (One year of work comes together here.) Combination of Gas and Gans is the next step over the coming weeks. Why the Gamma and X-ray leak beyond reactors. Now the speed of Light is a child's play. Using Deuterium in reactors.

The interaction of the Gans reactor with Hydrogen reactor that were in the lab, that is how we achieved the 130 Tesla. (2:47). A comet travels into our solar system has one charge and then switches charge. "we do get objects that enter the Plasma of our solar system from time to time, but the barrier is even stronger than that of upper atmosphere of earth and its much layered. The comets get burned up. So the comets in our solar system are from itself (explained in Book 4). Majority of comets in this solar system are from a conversion of a Gas into a Gans into Matter. Scientists say they're dirty snowballs, if they're from outside solar system, why do they come back regularly. They are like stars but have a loose orbit that goes to the outer edge of Solar System. The comets gather material in their movement, not dirt. (3:01). When 2 solar systems merge, you get a new creation. All fields get merged and something new produced. We only see the stars that are in tune with the field of our matter level. The dwarf planets beyond Pluto what happens? In time they come to where we are and we get sucked into the sun. The "dirt" particles in tail of comets, rub together and become a planet. Cotton candy machine works same way, collect at the edge around a stick. If you take a Gans of CuO and spin it at high speed, it becomes a light. This is part of communication systems for the future.
